

Private by default. Shared by choice.

ARBI is private AI for confidential legal work. Collaborate securely with anyone you choose — colleagues or outside counsel — with **granular control** over who can see each matter, document and conversation. Your work is encrypted so that **only you** can open it, runs on our own infrastructure rather than the public cloud, and is never used to train AI.

No back door — not even for us

We encrypt **confidential data at rest** and use **TLS / mTLS** in transit. Only you can unlock it — we keep no key of our own that can open your data, so there is nothing on our servers we can read.

You decide who sees each matter

Role-based access control with **SSO / OIDC** support: each matter is visible only to the people you invite — your team or outside counsel — with access set per document or conversation, and revocable in one click.

Private AI, no public cloud

The AI runs on our own models and infrastructure in the UK — not the public cloud. We use **zero-data-retention APIs** for large language models and **never train on your data**. Add OpenAI, Anthropic or Google only if you choose.

GDPR-compliant, UK-resident

GDPR data processor under a **DPA**, with **UK data residency** and an **ISO 27001-certified datacentre**.

AI agents stay scoped

When you delegate work to an AI agent, it runs under **its own account** with only the permissions you give it — and you can grant temporary, scoped workspace access when you need to.

Run it yourself

ARBI BOX

Run ARBI **self-hosted** — **on-premises** or on dedicated hardware, fully **air-gapped** if you need it. Your IT controls registration and admin.
